# Foreword

Today, more people are consuming more coffee than ever before. As the middle classes of the developing world continue to swell, as their incomes rise and coffee remains affordable, the luxury of the occasional coffee has become a daily habit in an ever-growing number of countries. The rising demand has also afforded producers with new options and opportunities. Coffee has become an important contributor to cash income for many smallholders, who produce most of the world's beans. The annual output has now reached almost nine million tonnes, one million tonnes more than a decade ago. The gross value of production of green coffee now exceeds US\$16 billion, and its export value reached US\$24 billion in 2012.

While rising demand offers unprecedented opportunities to growers, they also have to live up to a growing set of challenges. Many are confronted with inadequate access to credit, high price volatility, as well as bureaucratic hurdles at home and market barriers abroad. And, they are operating in a global value chain where a vast and often unorganized number of small coffee growers are exposed to the market power of a few, large traders and roasters. In addition, many smallholders find it hard to cope with the vagaries of weather in the short-run and the deteriorating growing conditions brought about by climate change over the longer-term.

This Pocketbook puts numbers to these developments, assesses short-term changes and long-term trends in production, consumption, trade and prices, and provides useful background information on related shifts in poverty, health and rural development. It is part of the FAO Statistical Yearbook suite of products and is organized around two major sections: thematic spreads with data-driven visualizations, and comprehensive country and regional profiles.

FAO is strongly committed to helping countries strengthen their national statistical systems and improve the timeliness and quality of their data. This includes a commitment to improve and broaden the information necessary to support evidence-based decision making by all stakeholders in the coffee value chain.

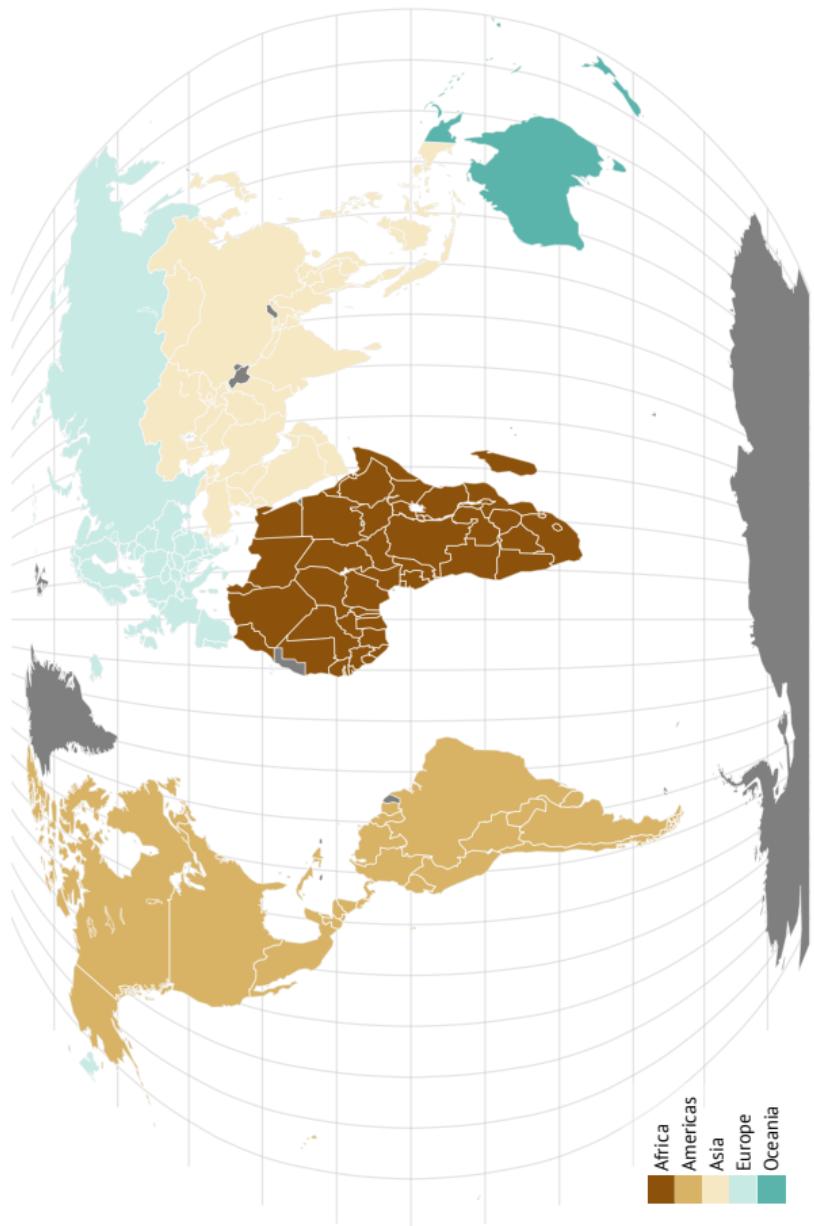

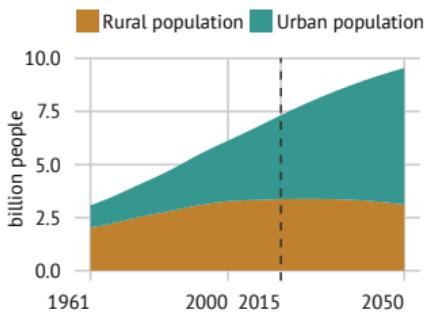

FIGURE 1: Classification of countries

## Overview

A combination of declining mortality rates, prolonged life expectancy and younger populations in regions with high fertility contributes to continuous, albeit declining population growth in the world. While rates continue to slow, the world's population has nevertheless doubled since the late 1960s, to over 7 billion people today. Generally, population growth is high where income levels are low. This is especially true in cities. Since 2008, more people live in cities than in rural areas.

Data after 2015 are projections

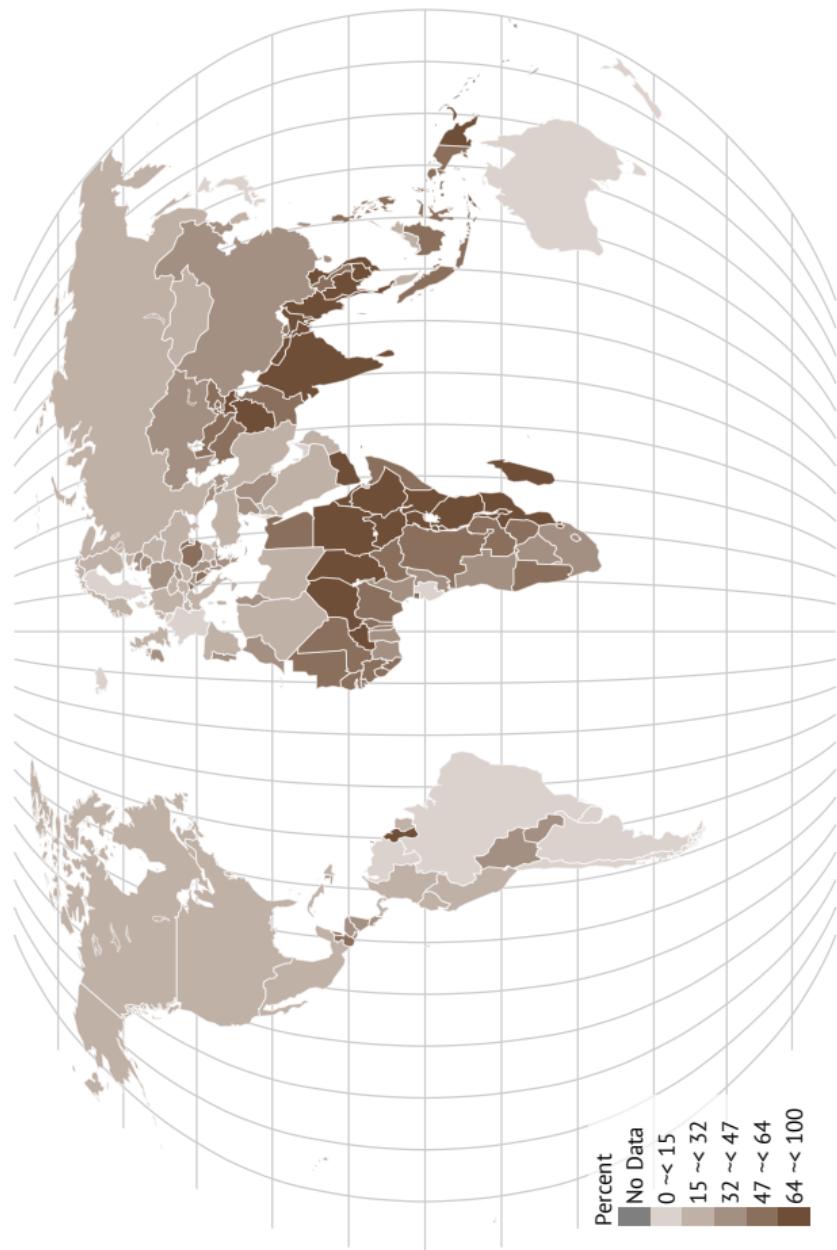

FIGURE 2: Rural population, share of total population (2014)

## Economy

Changes in the wider economy, including growing global integration – and therefore trade, currency movements and international prices – affect the performance of commodities in the agricultural sector, including coffee production. During the global economic downturn of the last decade, some sectors were particularly hard hit. Agriculture was affected too, but the coffee sector has demonstrated remarkable resilience. Since 2008, the value of coffee production has grown at over 3.5 percent per year, which is faster than 2.5 percent overall growth in agriculture.

## Poverty

Most coffee is produced in developing countries. Yet the benefits from the expansion of the coffee industry in recent years have not always trickled down to the poorest. Among the largest coffee producing countries, many still have more than 10 percent of their populations living below US\$1.25 a day. However, change is on the way, and coffee plays a pivotal role in this process. Coffee production and the proceeds from it have allowed a growing number of small and poor farmers to escape the poverty trap. By adapting new technologies or by switching to better varieties, many now harvest higher crops of better quality beans.

## Dietary energy supply

The dietary energy supply (DES) is the food available for human consumption, expressed in kilocalories per person per day. In 1961 the average global calorie availability was as low as 2 196 kcal/cap/day; by 2011, it had reached 2 870 kcal/cap/day, and consisted primarily of a base of staple grains, and meat and dairy products. Consumers of coffee have traditionally come from high-income countries but now include the growing middle classes in developing countries. In terms of calories, coffee and other stimulants still make up a very small part of food available for consumption.

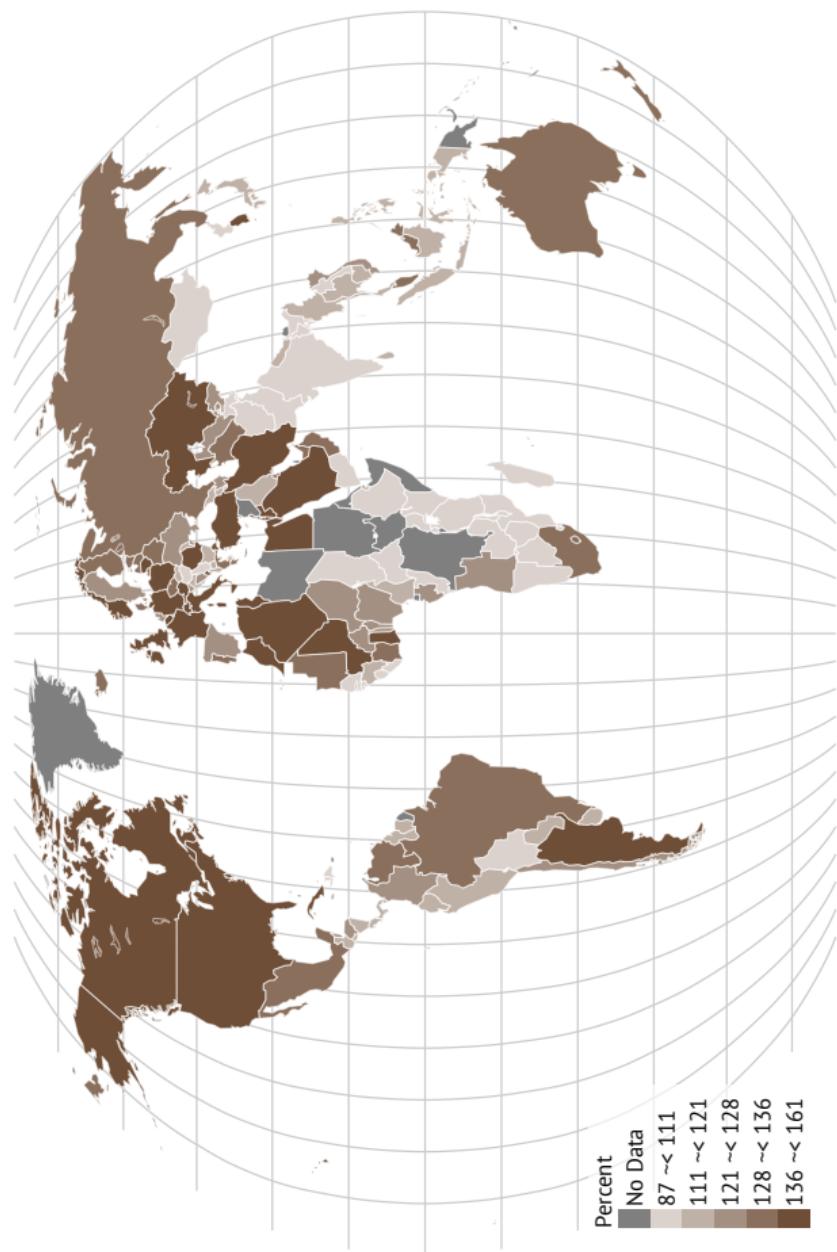

FIGURE 5: Average dietary energy supply adequacy, percent (2014-2016)

## Coffee production

Over the past 50 years, both production and consumption of coffee have risen considerably. Consumers have reaped some of the benefits through a greater variety of coffee products, improved quality and lower real prices. Now over 70 countries produce coffee, and over 50 percent comes from just three countries. Some coffee producing countries have seen considerable benefits through higher yields and growing volumes of sales. But many, especially small-holders, who produce the majority of the world's coffee, are also facing growing challenges from climate change and more difficult natural growing conditions.

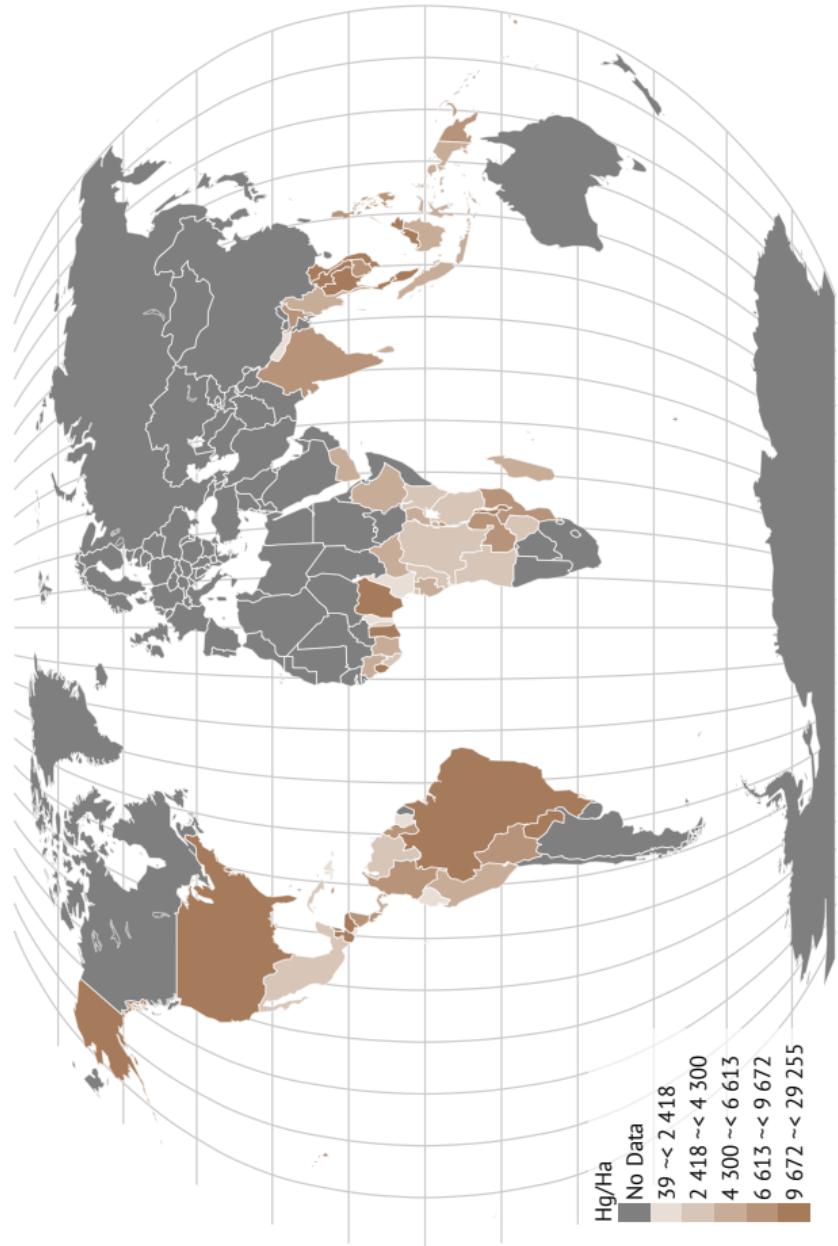

FIGURE 6: Coffee yield (2013)

## Coffee trade

Coffee is not only traded in large quantities, it also comes in a multitude of different qualities, varieties and forms. These include arabica and robusta, roasted or green, as well as instant and solubles. Coffee exports are also a key source of foreign exchange and national income for many developing countries. In 2012, total exports of 7 million tonnes accounted for a value of US\$24 billion. Just 10 years ago, the value was only US\$5.1 billion for a total of 5.5 million tonnes.

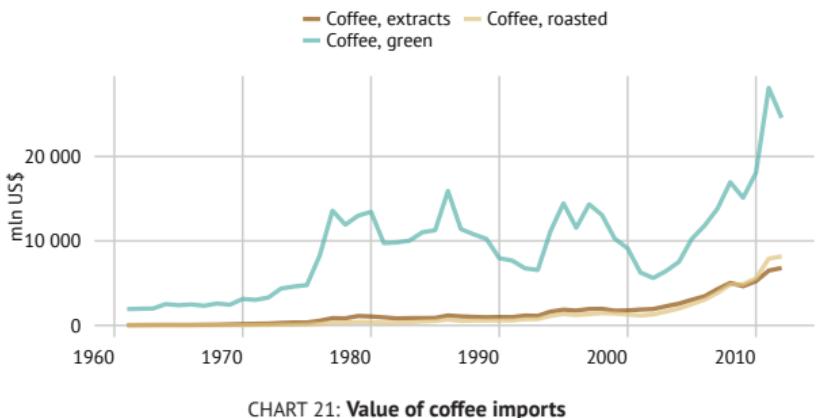

CHART 21: Value of coffee imports

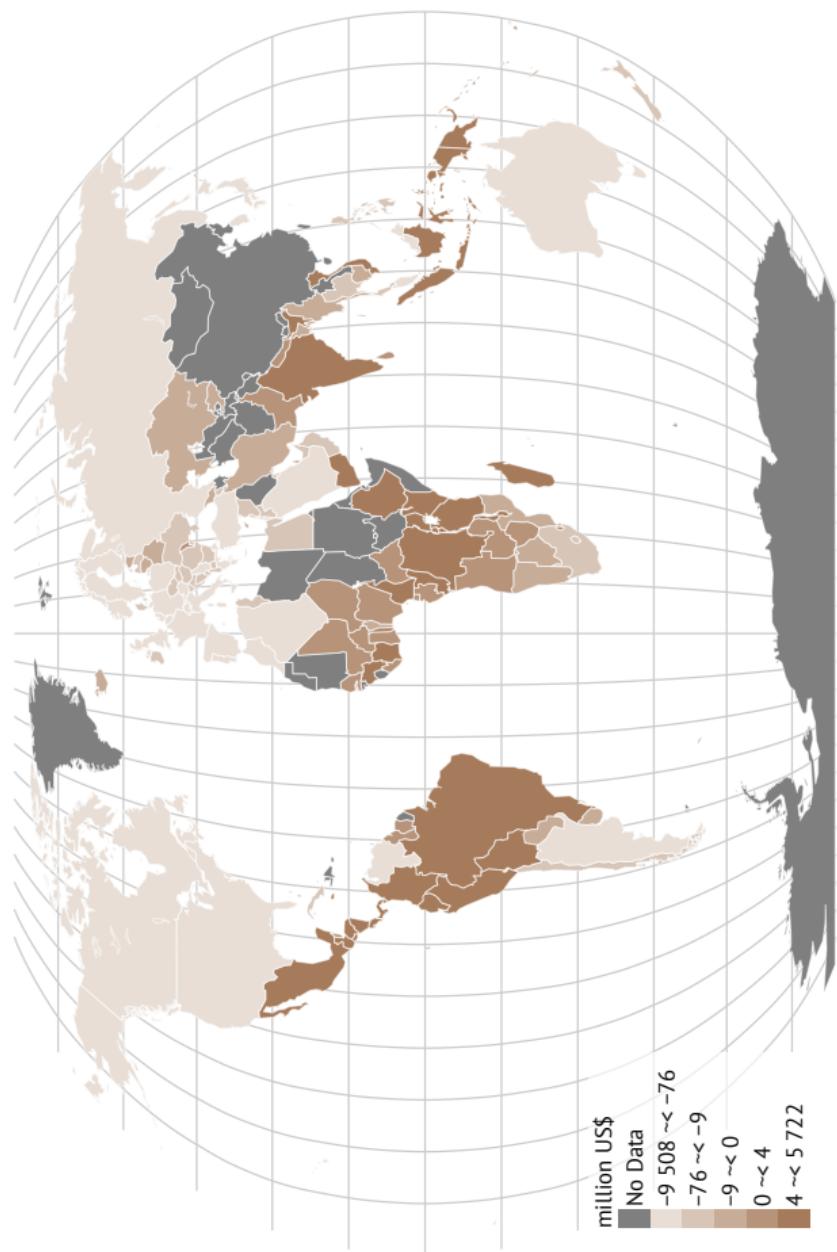

FIGURE 7: Net trade of coffee in 2012

## Coffee prices

Approximately 60 percent of the world's coffee production is arabica, while the other 40 percent is robusta. The former is generally considered of superior quality and fetches a higher price. The latter tends to be hardier and has a bitter taste. In developing countries, including China and Indonesia, robusta is now the bean of choice. Up until 2013, prices of arabica were declining, primarily due to the growing availability of the cheaper robusta beans on world markets. Between 2013 and 2014, however, prices of both types rose, arabica from US\$2.90 to US\$4.18 and robusta from US\$1.96 to US\$2.09.

## Agricultural production indices

The FAO indices of agricultural production show the relative level of the aggregate volume of agricultural production for each year in comparison with the base period 2004-2006. They are based on the sum of price-weighted quantities of different agricultural commodities produced after deductions of quantities used as seed and feed weighted in a similar manner. All the indices are calculated by the Laspeyres formula. Production quantities – except for fish – of each commodity – except for fish – are weighted by 2004-2006 average international commodity prices and summed for each year. To obtain the index, the aggregate for a given year is divided by the average aggregate for the base period 2004-2006. The fish index is only normalized to the base period 2004-06. Since the FAO indices are based on the concept of agriculture as a single enterprise, amounts of seed and feed are subtracted from the production data to avoid double counting them, once in the production data and once with the crops or livestock produced from them. Deductions for seed (in the case of eggs, for hatching) and for livestock and poultry feed apply to both domestically produced and imported commodities. They cover only primary agricultural products destined to animal feed (e.g. maize, potatoes, milk, etc.). Processed and semi-processed feed items such as bran, oilcakes, meals and molasses have been completely excluded from the calculations at all stages. When calculating indices of agricultural, food and non-food production, all intermediate primary inputs of agricultural origin are deducted. However, for indices of any other commodity group, only inputs originating from within the same group are deducted; thus, only seed is removed from the group "crops" and from all crop subgroups, such as cereals, oil crops, etc.; and both feed and seed originating from within the livestock sector (e.g. milk feed, hatching eggs) are removed from the group "livestock products". For the main two livestock subgroups, namely, meat and milk, only feed originating from the respective subgroup is removed. International commodity prices are used in order to avoid the use of exchange rates for obtaining continental and world aggregates and to improve international comparative analysis of productivity at the national level. These "international prices", expressed in "international dollars," are derived using a Geary-Khamis formula for the agricultural sector. This method assigns a single "price" to each commodity. The commodities covered in the computation of indices of agricultural production are all crops and livestock products originating in each country. The category of food production includes commodities that are considered edible and that contain nutrients, although it does not include fish. Accordingly, coffee and tea are excluded along with inedible commodities because, although edible, they have practically no nutritive value. Indices for meat production are computed based on data for production from indigenous animals, which takes account of the meat equivalent of exported live animals but excludes the meat equivalent of imported live animals. For index purposes, annual changes in livestock and poultry numbers or in their average live weight are not taken into account.

## Coffee, Green

Includes coffeea spp. (arabica, robusta, liberica). It is raw coffee in all forms.

*Source:* FAO, Statistics Division

*Owner:* FAO

## Coffee, Roasted

With or without caffeine, and may or may not be ground.

*Source:* FAO, Statistics Division

*Owner:* FAO

## Coffee, extracts

It is essences and concentrates, including instant coffee, roasted chicory and other coffee substitutes, extracts and essences thereof.

*Source:* FAO, Statistics Division

*Owner:* FAO

## Producer prices, agriculture

Prices received by farmers (called producer prices) for for primary crops, livestock products and live animals as collected at the point of initial sale (prices paid at the farm-gate).

*Source:* FAO, Statistics Division

*Owner:* FAO

## Vegetal (crop) products (kcal/cap/day)

Processed products of vegetal origin.

*Source:* FAO, Statistics Division

*Owner:* FAO

## Animal products (kcal/cap/day)

Processed products of animal origin.

*Source:* FAO, Statistics Division

*Owner:* FAO

## Dietary energy supply (kcal/pc/day)

The food available for human consumption, expressed in kilocalories per person per day. At the country level, it is calculated as the food remaining for human use after taking out all non-food utilization, including exports, industrial use, animal feed, seed, wastage and changes in stocks.

*Source:* FAO, Statistics Division

*Owner:* FAO

## Food imports and exports (mln US\$)

Food comprises the commodities in SITC sections 0 (food and live animals), 1 (beverages and tobacco), and 4 (animal and vegetable oils and fats) and SITC division 22 (oil seeds, oil nuts, and oil kernels).

*Source:* FAO, Statistics Division and Fisheries Division

*Owner:* FAO

## Food production index

The FAO indices of agricultural production show the relative level of the aggregate volume of agricultural production for each year in comparison with the base period 2004-2006. It should be noted that when calculating indices of agricultural, food and nonfood production, all intermediate primary inputs of agricultural origin are deducted.

*Source:* FAO, Statistics Division

## Food production value (gross)

Value of gross production has been compiled by multiplying gross production in physical terms by output prices at farm gate. Thus, value of production measures production in monetary terms at the farm gate level. Since intermediate uses within the agricultural sector (seed and feed) have not been subtracted from production data, this value of production aggregate refers to the notion of "gross production".

*Source:* FAO, Statistics Division

*Owner:* FAO

### **GDP per capita (US\$, PPP)**

Gross domestic product converted to international dollars using purchasing power parity rates. An international dollar has the same purchasing power over GDP as the U.S. dollar has in the United States. GDP at purchaser's prices is the sum of gross value added by all resident producers in the economy plus any product taxes and minus any subsidies not included in the value of the products. It is calculated without making deductions for depreciation of fabricated assets or for depletion and degradation of natural resources. Data are in constant 2011 international dollars.

*Source:* FAO, Statistics Division

*Owner:* World Bank

### **Improved water source (%)**

Refers to the percentage of the population with reasonable access to an adequate amount of water from an improved source, such as a household connection, public standpipe, borehole, protected well or spring, and rainwater collection. Unimproved sources include vendors, tanker trucks, and unprotected wells and springs. Reasonable access is defined as the availability of at least 20 liters a person a day from a source within one kilometer of the dwelling.

*Source:* World Bank

*Owner:* World Health Organization and United Nations Children's Fund, Joint Measurement Programme (JMP)

### **Income share held by highest 20% (percent)**

Percentage share of income or consumption is the share that accrues to subgroups of population indicated by deciles or quintiles. Percentage shares by quintile may not sum to 100 because of rounding.

*Source:* World Bank, Development Research Group. Data are based on primary household survey data obtained from government statistical agencies and World Bank country departments. Data for high-income economies are from the Luxembourg Income Study database. For more information and methodology, please see PovcalNet (<http://iresearch.worldbank.org/PovcalNet/index.htm>).  
*Owner:* World Bank (WDI)

### **Life expectancy at birth (years)**

Indicates the number of years a newborn infant would live if prevailing patterns of mortality at the time of its birth were to stay the same throughout its life.

*Source:* World Bank

*Owner:* UNPD World Population Prospects 2010

### **Net trade**

The sum of exports and imports of goods and services.

*Source:* FAO, Statistics Division

*Owner:* FAO

### **Organic area (%)**

Sum of areas under "Agricultural area certified organic" and "Agricultural area in conversion to organic". Agricultural area certified organic is the land area exclusively dedicated to organic agriculture and managed by applying organic agriculture methods. It refers to the land area fully converted to organic agriculture. It is the portion of land area (including arable lands, pastures or wild areas) managed (cultivated) or wild harvested in accordance with specific organic standards or technical regulations and that has been inspected and approved by a

certification body. Agricultural area in conversion to organic is the land area which is going through the organic conversion process, usually two years period of conversion to organic land.

*Source:* FAO, Statistics Division

*Owner:* FAO

### **Population with access to sanitation facilities (%)**

Refers to the percentage of the population with at least adequate access to excreta disposal facilities that can effectively prevent human, animal, and insect contact with excreta. Improved facilities range from simple but protected pit latrines to flush toilets with a sewerage connection. To be effective, facilities must be correctly constructed and properly maintained.

*Source:* World Bank

*Owner:* World Health Organization and United Nations Children's Fund, Joint Measurement Programme (JMP)

### **Population, rural**

De facto population living in areas classified as rural (that is, it is the difference between the total population of a country and its urban population). Data refer to 1 July of the year indicated and are presented in thousands.

*Source:* FAO, Statistics Division

*Owner:* United Nations Population Division, World Urbanization Prospects.

### **Population, total**

De facto population in a country, area or region as of 1 July of the year indicated.

*Source:* FAO, Statistics Division

*Owner:* World Population Prospects: The 2012 Revision from the UN Population Division

### **Poverty headcount ratio at \$1.25 a day PPP (percent of population)**

Population below \$1.25 a day is the percentage of the population living on less than \$1.25 a day at 2005 international prices. As a result of revisions in PPP exchange rates, poverty rates for individual countries cannot be compared with poverty rates reported in earlier editions.

*Source:* World Bank, Development Research Group. Data are based on primary household survey data obtained from government statistical agencies and World Bank country departments. Data for high-income economies are from the Luxembourg Income Study database. For more information and methodology, please see PovcalNet (<http://iresearch.worldbank.org/PovcalNet/index.htm>).  
*Owner:* World Bank (WDI)

### **Poverty headcount ratio at national poverty line (percent of population)**

The percentage of the population living below the national poverty lines. National estimates are based on population-weighted subgroup estimates from household surveys.

*Source:* Global Poverty Working Group. Data are based on World Bank's country poverty assessments and country Poverty Reduction Strategies.

*Owner:* World Bank (WDI)

### **Poverty headcount ratio at rural poverty line (percent of rural population)**

Rural poverty rate is the percentage of the rural population living below the national rural poverty line.

*Source:* Global Poverty Working Group. Data are based on World Bank's country poverty

assessments and country Poverty Reduction Strategies.

*Owner:* World Bank (WDI)

#### **Prevalence of undernourishment**

Expresses the probability that a randomly selected individual from the population consumes an amount of calories that is insufficient to cover her/his energy requirement for an active and healthy life. The indicator is computed by comparing a probability distribution of habitual daily dietary energy consumption with a threshold level called the minimum dietary energy Requirement. Both are based on the notion of an average individual in the reference population.

*Source:* FAO, Statistics Division

*Owner:* FAO

#### **Primary completion rate, total (percent of relevant age group)**

Primary completion rate is the percentage of students completing the last year of primary school. It is calculated by taking the total number of students in the last grade of primary school, minus the number of repeaters in that grade, divided by the total number of children of official graduation age.

*Source:* United Nations Educational, Scientific, and Cultural Organization (UNESCO) Institute for Statistics.

*Owner:* World Bank (WDI)

#### **Renewable water resources withdrawn (% of total)**

The total volume of groundwater and surface water withdrawn from their sources for human use (in the agricultural, municipal and industrial sectors), expressed as a percentage of the total actual renewable water resources.

*Source:* Land and Water Division (AQUASTAT)

*Owner:* FAO

#### **Terrestrial protected areas (% total land area)**

Totally or partially protected areas of at least 1,000 hectares that are designated by national authorities as scientific reserves with limited public access, national parks, natural monuments, nature reserves or wildlife sanctuaries, protected landscapes, and areas managed mainly for sustainable use. Marine areas, unclassified areas, littoral (intertidal) areas, and sites protected under local or provincial law are excluded.

*Source:* World Bank

*Owner:* United Nations Environmental Program and the World Conservation Monitoring Centre, as compiled by the World Resources Institute

#### **Value added, agriculture**

Agriculture corresponds to ISIC divisions 1-5 and includes forestry, hunting, and fishing, as well as cultivation of crops and livestock production. Value added is the net output of a sector after adding up all outputs and subtracting intermediate inputs. It is calculated without making deductions for depreciation of fabricated assets or depletion and degradation of natural resources. The origin of value added is determined by the International Standard Industrial Classification (ISIC), revision 3.

*Source:* World Development Indicators, World Bank

*Owner:* World Bank

#### **Value added, industry**

Industry corresponds to ISIC divisions 10-45 and includes manufacturing (ISIC divisions 15-37). It comprises value added in mining, manufacturing (also reported as a separate subgroup), construction, electricity, water, and gas. Value added is the net output of a sector after adding up all outputs and subtracting intermediate inputs. It is calculated without making deductions for depreciation of fabricated assets or depletion and degradation of natural resources. The origin of value added is determined by the International Standard Industrial Classification (ISIC), revision 3.

*Source:* World Development Indicators, World Bank

*Owner:* World Bank

#### **Value added, services**

Services correspond to ISIC divisions 50-99 and they include value added in wholesale and retail trade (including hotels and restaurants), transport, and government, financial, professional, and personal services such as education, health care, and real estate services. Also included are imputed bank service charges, import duties, and any statistical discrepancies noted by national compilers as well as discrepancies arising from rescaling. Value added is the net output of a sector after adding up all outputs and subtracting intermediate inputs. It is calculated without making deductions for depreciation of fabricated assets or depletion and degradation of natural resources. The industrial origin of value added is determined by the International Standard Industrial Classification (ISIC), revision 3.

*Source:* World Development Indicators, World Bank

*Owner:* World Bank

#### **Water withdrawal, agriculture (% of total)**

Annual quantity of water withdrawn for irrigation, livestock and aquaculture purposes. It includes renewable freshwater resources as well as over-abstraction of renewable groundwater or withdrawal of fossil groundwater, use of agricultural drainage water, (treated) wastewater and desalinated water.

*Source:* Land and Water Division (AQUASTAT)

*Owner:* FAO

# Notes

The country classification adopted in this publication is based on the United Nations M49 classification (<http://unstats.un.org/unsd/methods/m49/m49.htm>). The country names have been abbreviated for the purpose of this publication. The official FAO names can be found at <http://termportal.fao.org/faonocs/app/>.

The asterisk in charts and maps indicates the most recent year available in the specified time interval. In the country profiles, when the country data have not been reported for the reference year, data in italics indicate that the value for the most recent year available is shown.

In the tables, a blank means not applicable or, for an aggregate, not analytically meaningful. A 0 or 0.0 means zero or a number that is small enough to round to zero at the displayed number of decimal places.

The ~ in the maps refers to the range specified in the class intervals.

In addition:

- <5.0 proportion less than 5 percent
- <0.1 less than 100 000 people
- ns not statistically significant

Two types of aggregations are used in the book: sum and weighted mean. Two restrictions are imposed when computing the aggregation: i) the sufficiency condition – the aggregation is computed only when sufficient countries have reported data, and the current threshold is set at 50 percent of the variable and the weighting variable, if present; and ii) the comparability condition – as aggregations are usually computed over time, this condition is designed to ensure that the number of countries is comparable over several years; under the current restriction the number of countries may not vary by more than 15 over time.

This publication was carried out under the direction of Pietro Gennari (Chief Statistician and Director, ESS) and Josef Schmidhuber (Deputy Director, ESS). It was prepared by the Statistics Division (Amy Heyman and Markus Kainu). A special thanks the team leaders for their input and to Nicola Selleri (ESS) for the cover design.
